

Prompts Used for 2D Graphics Editor Project

1. Explain the problem statement for creating a menu-driven 2D Graphics Editor in C using a 2D character array.
2. Help me design a C program where a drawing canvas is represented using rows and columns in a character array.
3. Generate C code to initialize a 2D canvas with underscore characters and draw graphical objects using asterisks.
4. Create separate functions in C to draw a rectangle, line, triangle, and circle on a terminal-based canvas.
5. Explain how coordinate values such as x and y can be used to position shapes correctly inside a 2D array.
6. Develop a menu-driven structure in C using switch-case statements for different graphics editor operations.
7. Add features to the program that allow the user to add new shapes to the canvas.
8. Add features to delete existing graphical objects from the canvas.
9. Add features to modify already created shapes by changing their position or dimensions.
10. Create a display function that prints the complete 2D drawing canvas row by row in the terminal.

11. Improve the program by using functions, loops, arrays, and structures to make the code more organized.

12. Generate a README file for the project including the project description, features, compilation steps, and execution instructions.

13. Provide GitHub steps for creating a repository and uploading the C project files.

14. Suggest suitable commit messages for uploading the source code and README file to GitHub.

15. Explain the final 2D Graphics Editor program in simple words for assignment understanding and presentation.
